

The SZL Agent Body — v3, drawn from the disk up

Most AI architecture diagrams are wishlists. Boxes labeled with capabilities the system does not have.

This one isn't. Every organ on the page is a file on disk with a SHA-256 hash that replays five times byte-identical.

The SZL Agent Body — v3.

BRAIN. Two muscles: Claude SDK as primary, llama-3.1-70b as default. Above them, YUYAY rubric as conjunctive judge. The brain reads the receipt bus through a single tether. It cannot write. By construction.

HEART — yuyay_v3, hash bacf5443. 430 SLOC. 13 axes evaluated AND, not averaged. Nine clear 0.90. moralGrounding and measurabilityHonesty clear 0.95. Five replays byte-identical. Fail any axis and the proposal dies in the cortex.

OVERWATCH — r0513, df4e9741. 146 SLOC. Five invariants. Read-only.

DECIDE arm — RIMAY, MUSQUY, TUKUY. Proposer, k-candidate sim, egress actuator (219 + 70 SLOC).

HATUN-RAID — 6381bc23. 199 SLOC sovereign orchestrator. HUKLLA sits as observer with 10 deterministic tripwires checked before AND after each cycle.

MAKI — the hands. Five typed retrieval fingers: vector, doc, structured, web, tool. Every fact returned carries a continuum_hash.

CHAKI — the feet. Postgres + Redis + WAL. Snowflake wired but auth pending. I do not show it live until it is.

SENTRA — immune. 18 SLOC inline egress inspector. Six threat signatures + 1MB DoS guard.

YAWAR — the blood. 20 SLOC. sha256(json.dumps(packet, sort_keys=True)) per receipt. Immutable.

Tier 1 kernel total: 1,365 SLOC. yawar 20, sentra 18, HUKLLA 660, musquy 219, tukuy 70, yuyay_v3 430.

Six canonical replay hashes: yuyay_v3 bacf5443, r0513 df4e9741, hatun-raid 6381bc23, t7 43f0c3a9, qm ea65ddc5, chakra_2_sacral e9fac882.

Five doctrines on the spine: D-SHORTEST-HONEST. D-CODEX-IN-KERNEL. D-YAWAR-FLOW. D-HITCHHIKE-PROOF. D-SPRINGBOARD.

Licenses on the page, not in a footnote: Apache-2.0, MIT, BSD-3, CC-BY-4.0. Public ingestion only. No proprietary shadow.

This is what doctrine looks like when you draw it.

Receipts available on request.
