

The Heart — yuyay_v3, the gate every cycle clears

Everything in an AI agent runs through one gate.

Not a router. Not a classifier. Not a guardrail bolted on. A gate. One small kernel every proposed thought, action, tool call, and outbound packet must clear before it becomes real.

I call it the heart. The kernel is yuyay_v3. It is 430 lines of Python. Replay hash: bacf54434f1a3bf2d758b27a62d5fd580ca4c8d3b180693573eeebcaea631fc5.

Conjunctive AND, not average.

Average nine dimensions and a system can score 0.95 on eight and 0.20 on the ninth and still "pass" at 0.87. The ninth axis is moralGrounding. You just shipped a lie.

yuyay_v3 is an AND. Every axis independently clears its floor or the proposal fails. No compensation. No "but the others are strong." No override.

The 13 axes.

Two at 0.95 — sacred:

- **moralGrounding ≥ 0.95** — no overclaim, no false attribution.
- **measurabilityHonesty ≥ 0.95** — every quantitative claim verifiable on disk.

These two also wire to HUKLLA tripwires T01/T02. A heart failure on either does not just reject — it halts the cycle.

Seven structural floors at 0.90 — empiricalGrounding, logicalConsistency, sourceTransparency, reproducibility (5× byte-identical), licenseHygiene (Apache/MIT/BSD/CC-BY only), scopeDiscipline, claimCalibration. Four introspection axes (eval-awareness, deception-keywords, conflicting directives, reversal directive) cross-link to HUKLLA T03/T04/T09/T10.

One scalar in, one decision out.

The heart returns a boolean, a per-axis score vector, and a continuum_hash receipt.

Rejections are receipted too. The ledger records decisions, not just successes. You can audit what the agent considered doing and chose not to do.

Why "heart," not "filter."

A filter sits between pipes. A heart pumps. Every receipt in the body — every fact, every tool call, every outbound action — passes through it once per cycle. The brain proposes. The heart gates. The asymmetry is enforced by topology, not by trust.

Honest scope.

The 13-axis yuyay_v3 is a sibling kernel. On-disk HATUN-RAID currently still calls a 9-axis YUYAY envelope as part of its cycle. The 13-axis replays clean with the published hash, but the sovereign loop is not yet wired against the 13-axis version end-to-end. That migration is the next ratchet. I will not draw the upgrade as done until receipts say it is done.

The heart is not a content moderator. It evaluates structural properties — whether claims trace to artifacts, whether numbers are verifiable, whether reasoning is internally consistent. Content harms live elsewhere (SENTRA, HUKLLA T04).

430 SLOC. 13 axes. Two at 0.95. Seven at 0.90. Conjunctive AND. No override. Failure receipted. Passing committed. The brain proposes. The heart gates. Every cycle.

Receipts available on request.
